

## Are you pouring and worried about blotchy uneven appearance when using plastic and blankets?

Blankets and plastics are excellent curing stand alone methods, both meet ASTM C 156 for moisture retaining but can leave behind “tiger striping.” The Bean does not qualify as a curing compound; however, when curing blankets and plastics are being used, an application of The Bean has been found to minimize or eliminate discoloration due to condensation lines (tiger stripes).

The Bean is applied after broomfinishing and prior to placing the blankets. This sealer will penetrate fully into the surface and not result in a shiny surface. This patented formula is designed to penetrate the pores of concrete from which it will quickly disperse water. This method of protection does not bead water.
